# Comparing success rates for general and credit recovery courses online and face to face: Results for Florida high school courses

John Hughes  
Chengfu Zhou  
Yaacov Petscher

Florida Center for Reading Research at Florida State University

## Key findings

Grade 9–11 students in Florida were more likely to earn a grade of C or better when taking an academic course online rather than face to face for both general online courses and credit recovery courses. Most subgroups of students were also more likely to succeed in online courses. The success gap between online and face-to-face courses was highest in grade 9 and diminished through grade 12. However, English learner students showed no difference between online and face-to-face credit recovery courses. It is not possible to determine from this study whether differences in course outcomes are due to greater student learning or other factors.

## Summary

The perceived potential for online education to improve education outcomes and save money has led to substantial increases in its use. The number of school districts using online education and the total number of online courses have increased considerably, and there is no reason to expect that trend to reverse (Queen and Lewis, 2011; U.S. Department of Education, 2011). One major use for online courses is to provide K–12 students the opportunity to retake required courses to make up graduation credits for courses they failed previously, known as credit recovery (Andrie, 2012; Davis, 2011; Dessoiff, 2009; Plummer, 2012). Many states, particularly in the Regional Educational Laboratory Southeast Region, identify credit recovery as a major objective for online courses (Queen and Lewis, 2011). However, little research has compared student outcomes in online courses with student outcomes in face-to-face courses, whether for credit recovery or more generally.

This study examined whether Florida high school students in online courses earned a grade of C or better at different rates from students in the same courses face to face. Course grades have limitations as an outcome measure because they are inherently subjective. However, grades are directly related to the accumulation of high school credits. The analyses include general online academic courses and credit recovery courses. Additionally, the study compared outcomes for key demographic subgroups.

In general, students were more likely to earn a C or better in online courses than in face-to-face courses. This held true in both general courses and credit recovery courses as well as for most subgroups. English learner students were an exception: their success in online and face-to-face courses was about the same. Grade 9 students in online courses were likely to outperform students in face-to-face courses by the widest margin, and the margin narrowed at each higher grade level. Grade 12 students typically had the smallest differences in success rates between online and face-to-face courses.

It is not possible to determine from this study whether the differences in course outcomes are attributable to greater student learning, other factors such as differences in student characteristics that were not measured, or differences in grading standards.

## Why this study?

The perceived potential for online education to improve education outcomes and save money has led to considerable expansion of its use. Nationally, online course enrollment increased almost sixfold in 10 years, from 317,000 in 2002/03 to more than 1.8 million in 2009/10 (U.S. Department of Education, 2011). Growth has been greatest in the Southeast United States, where enrollment grew 876 percent and where 78 percent of school districts have at least one student enrolled in distance education courses (table 1).

Leading the national trend, Florida has actively embraced online learning. Florida established the country's first statewide virtual school in 1997, the Florida Virtual School, which remains the largest such program, accounting for 50 percent of nationwide enrollment in virtual schools (Watson, Pape, Murin, Gemin, and Vashaw, 2014). In 2011 Florida enacted legislation that expanded the range of blended and online learning options and required that all students complete at least one online course for high school graduation (Watson, Murin, Vashaw, Gemin, and Rapp, 2011). The continuing expansion of online learning led members of the Regional Educational Laboratory Southeast Blended and Online Learning Research Alliance to seek information comparing online and face-to-face course outcomes.

This study examines whether Florida high school students in online courses earned a grade of C or better at different rates from students in the same courses face to face. Course grades have limitations as an outcome measure because they are inherently subjective. However, grades are directly related to the accumulation of high school credits and are therefore a critical aspect of high school graduation rates. The analyses began with general online academic courses to better understand what courses students take online and how outcomes in those courses might differ from outcomes in face-to-face versions. The study also examines outcomes in credit recovery courses. Finally, the study compares results for key demographic subgroups.

Credit recovery is a common reason for high school students to enroll in online courses. Online education is seen as a practical and flexible way to allow students to retake required courses that they had failed previously. In fact, most school districts say offering these credit recovery courses is a major reason for providing online courses (Queen and Lewis, 2011). Yet existing research has not shown that online courses produce better learning or better grades in either general or credit recovery courses (box 1).

*The perceived potential for online education to improve education outcomes and save money has led to considerable expansion of its use*

**Table 1. Magnitude of online education by region (percent)**

| Region                 | Increase in number of students enrolled in technology based distance education courses (2003–10) | Share of districts with students enrolled in distance education (2009–10) |

---

**Box 1. What existing research has reported about student learning from online courses**

Existing research provides theoretical reasons why online instruction could improve learning in general and enhance credit recovery efforts. Poor attendance and work effort were found to be strong predictors of grade 9 course failures (Allensworth and Easton, 2007). Online instruction, with its more flexible design and schedule, may improve attendance (Franco and Patel, 2011). Well-designed and personalized online courses could also lead to higher levels of student engagement (Heppen et al., 2012).

However, online instruction might not always enhance student learning, particularly for students who need credit recovery. These students, by definition, are struggling and are more likely to lack the self-regulatory skills, such as time management, needed for success (Franco and Patel, 2011; Roblyer and Marshall, 2002). Thus, while use of online courses for credit recovery presents opportunities for students, it is not certain that students will benefit from them.

Although using online courses for credit recovery is becoming increasingly common (Andrie, 2012; Davis, 2011; Dessoiff, 2009; Plummer, 2012), analyses of its effectiveness are limited. One pilot study of 23 teacher-nominated students found positive results for a single high school with a self-paced summer program using online and traditional curricula (Franco and Patel, 2011). While the outcomes appear promising, the results are of limited use for three reasons. First, the sample size was small, and the teachers were instructed to nominate students likely to be successful. Second, the analysis did not contrast the online course with a similar face-to-face course. Finally, the fact that all students in the pilot passed the credit recovery course raises concerns that the standards for passing may not have been meaningful.

***This study examines whether Florida high school students in online courses earned a grade of C or better at different rates from students in the same courses face to face***

---

**What the study examined**

Using data from Florida, this study addressed two questions related to online learning in all academic courses generally and credit recovery courses specifically:

- Is the likelihood of earning a C or better in general academic courses statistically different between online courses and face-to-face courses?
- Is the likelihood of earning a C or better in credit recovery courses statistically different between online courses and face-to-face courses?

From a policy perspective it is important to examine whether the results obtained for the broader population of students also hold true for subgroups of students. This leads to a third research question:

- For both general and credit recovery courses, does the likelihood of earning a C or better differ for specific subgroups of students?

To answer this last question, the results for each research question are presented for key demographic subgroups: Black students, Hispanic students, students eligible for the federal school lunch program (a proxy for low-income status), students in special education (which the Florida Department of Education refers to as “exceptional education students”), and English learner students.

Results are also disaggregated based on whether students had passed both the reading and math portions of the prior year’s Florida Comprehensive Assessment Test (FCAT), which

was given in grades 3–10 (box 2). Comparing results based on FCAT success allows for analysis of any differences in online course performance between higher and lower performing students. (See box 3 for a summary of the data, sample, and methods and appendix A for details.)

The results from this research are expected to inform discussions of online education for credit recovery at both the state and local levels. Considerable money and effort have been spent to increase the use of online courses and, in Florida, to mandate that students take them. Florida legislators and district leaders need information about the potential value of the courses in terms of content quality and student outcomes in order to better understand the consequences of the state’s policies. They also need information to guide future implementation—for example, whether online courses are appropriate for different types of students. Even if students are successful on average, some student subgroups may not be as likely to succeed in online courses—especially important for credit recovery courses because they may be the final opportunity for students who have failed a course to graduate. Educators need to be able to recommend the options most likely to result in a successful outcome for that student or to provide support services when needed.

*Florida legislators and district leaders need information about the potential value of online courses in terms of content quality and student outcomes in order to better understand the consequences of the state’s policies*

---

## **Box 2. Key terms**

**Course grade.** The key outcome measure for this study. This is the only available outcome measure because end-of-course exams were not widely implemented during the years encompassed by this study. Despite Florida policies that require all courses, including online courses, to be based on the applicable state standards and graded on a standard 10-point scale, course grades necessarily retain elements of subjectivity.

For two-semester courses with two grades, this study used the grade for the first semester because it is most proximal to the failed course.

**Course success and successful credit recovery.** Defined for this study as earning a C or better. While “passing” a course requires only a grade of D, Florida high school graduation requires a 2.0 grade point average. In addition, students are eligible for grade forgiveness (see below) if they receive a grade of D. A grade of C was used as the cutoff to measure success in a course and in credit recovery because it reflects more stringent criteria for successful completion.

**Credit recovery.** Retaking a previously failed course required for graduation. For example, a student who needs English 1 to graduate, but fails the course, may retake English 1 at a later date to “recover” that credit. Credit recovery is distinct from grade replacement or forgiveness (see below).

**Face-to-face courses.** Courses taken in person in a traditional classroom setting.

**Florida Comprehensive Assessment Test (FCAT).** The FCAT is administered in the spring of grades 3–10 for reading and math. Results translate into achievement levels of 1–5, with levels 3 and above considered at grade level or “passing” for the purposes of these analyses. The FCAT results were collapsed into a single score where 1 means that the student has passed both the reading and math sections and 0 means that the student has failed one or more sections. The FCAT score used for each student was either the score from the year prior to the online course or, if the student was in grade 12, the grade 10 score.

(continued)

---

## Box 2. Key terms (continued)

**Grade replacement or forgiveness.** Retaking a course that a student passes with a low grade, such as a D, to earn a higher grade.

**Online courses or distance education courses.** Defined by the Florida Department of Education (2015) as a course in which “instruction is delivered using distance learning technology in an interactive learning environment with some element of student control over time, place, path, and/or pace.” For the purposes of this report, distance education courses and online courses are the same.

**Online course identification.** Used to identify all courses provided by a district virtual program or through the Florida Virtual School. Because the Florida Department of Education database does not contain an online course identifier for each year covered by the study, the state’s master school identification number was used.

**Credit recovery course identification.** Process used to identify when a student retakes a course. Identifying a credit recovery course relied on the Florida Department of Education database field indicating whether a course was included or excluded from the high school transcript for graduation. The include/exclude flag is found in the transcript designator file. When a student first takes a course, it is designated as “include” for the final transcript. But if a student retakes a course, the first course is switched to “exclude,” and the replacement course is included in the final transcript. A credit recovery course was defined as the second course if the first course had a grade of F and was excluded and if the second course was included. Because this method requires reviewing repeated courses, most often across years, and the transcript data begin with 2007/08, the credit recovery course analyses were limited to 2008/09–2010/11.

---

---

## Box 3. Data, sample, and methods

**Data.** This study used Florida Department of Education data including a statewide dataset of de-identified transcripts for students taking high school courses for 2007/08–2010/11. The dataset included information on each course: the course name and number, grade, year and term, credit earned, and school of instruction. The department also provided demographic information on each student, including scores on the statewide reading and math assessments for students in grades 3–10 (see discussion of the FCAT in box 2).

**Sample.** This study presents results for the 20 most common academic courses from two samples. The first sample represents all high school courses taken between 2007/08 and 2010/11. Because this sample includes all courses, credit recovery and any other types of course are included. The second sample is a smaller one that includes only credit recovery courses (see appendix B).

Both samples were limited to a subset of the 20 most common academic courses to ensure that the grades used for defining course success (see box 2 for definition) come from similar courses. For example, including online grades from courses that were substantially different from the courses that face-to-face grades were from would introduce a potential source

(continued)

---

---

### Box 3. Data, sample, and methods *(continued)*

of error. In addition, physical education and driver's education courses were excluded to focus the analyses on the kinds of academic courses targeted by credit recovery policies.

**Methodology.** The likelihood of a student earning a C or better was determined using a common statistical approach (logistic regression) to estimate the odds of an event occurring when that event has two possible outcomes—such as a student earning a C or better versus earning a D or F. The odds were then converted to a percentage chance of the event occurring. The same approach was used for the overall student population and then for five key subgroups—Black students, Hispanic students, students eligible for the federal school lunch program, students in special education, and English learner students (see appendix B for full results).

The difference in the likelihood of success between online and face-to-face courses was calculated using a dummy variable (a variable with two possible values: 0 for a face-to-face course and 1 for an online course). A positive coefficient for the dummy variable means that taking the course online increases the student's probability of earning a C or better, and a negative coefficient means that it decreases the probability of earning a C or better. See appendix A for details and appendix B for the estimated coefficients.

The findings are noted as statistically significant or not statistically significant. There is an unavoidable margin of error for all results. Although the margin of error is not explicitly indicated, when results are statistically significant, it is unlikely that they are due to random error. For the purposes of this study, a value of  $p < .05$  is used to determine statistical significance, meaning there is a 5 percent or less chance of the results being due to random error.

---

*In general academic courses students were more likely to earn a C or better in online courses than in face-to-face courses in grades 9–11*

### What the study found

In general academic courses students were more likely to earn a C or better in online courses than in face-to-face courses in grades 9–11. The differences were largest in grade 9 and shrank in each higher grade level. In grade 12 the differences were the smallest. The differences were also largest for students with prior-year FCAT scores below 3. The increase in the likelihood of success in online courses was larger for students with lower prior-year test scores than for students with higher prior-year test scores.

For students in most subgroups, the likelihood of receiving higher grades in general academic courses was higher in online courses than in face-to-face courses in grades 9–11, though differences diminished with each grade level. In grade 12 the online advantage disappeared or was negative (meaning that students would do better in face-to-face courses) for some subgroups (Black students with FCAT scores over 3, English learner students with FCAT scores less than 3, and students eligible for the federal school lunch program). Students eligible for the school lunch program were likely to do slightly better or the same in online courses as in face-to-face courses in grades 9–11, if their FCAT score was 3 or greater, but were more likely to do better in face-to-face courses than in online courses in grade 12.

In credit recovery courses students were more likely to succeed in online courses than in face-to-face courses in grades 9–11. Grade 9 students showed the largest difference in likely success rates (33–36 percentage points). The success gap narrowed in grades 10 and 11 and nearly disappeared in grade 12.

Students in all subgroups except English learner students were more likely to earn a C or better in online credit recovery courses than in face-to-face ones in grades 9–11. In grade 12 there were small or no differences for most subgroups.

*In credit recovery courses students were more likely to succeed in online courses than in face-to-face courses in grades 9–11*

English learner students were the only subgroup that did not show a positive difference in the likelihood of earning a C or better in online versus face-to-face courses for any grade level in either general academic courses or credit recovery courses.

**The most common online courses included such traditional academic courses as Spanish, English, history, and math**

This report focuses on traditional academic high school courses. While such courses were among the most common online courses, nonacademic courses such as driver’s education and physical education accounted for five of the six most common courses (see box 3 for a description of how courses were categorized and appendix B for counts of all courses). Those nonacademic courses were excluded from the analyses since they are not the focus of credit recovery policies. The 20 most common online courses included in the analyses are presented in table 2.

**Table 2. Enrollment in the 20 most common online academic courses in Florida, 2007/08–2010/11**

| Course   | 2007/08 | 2008/09 | 2009/10 | 2010/11      | Total, 2007/08–2010/11 |
|--|---------|---------|---------|--------------|------------------------|

## Students taking online courses were demographically different from students not taking online courses

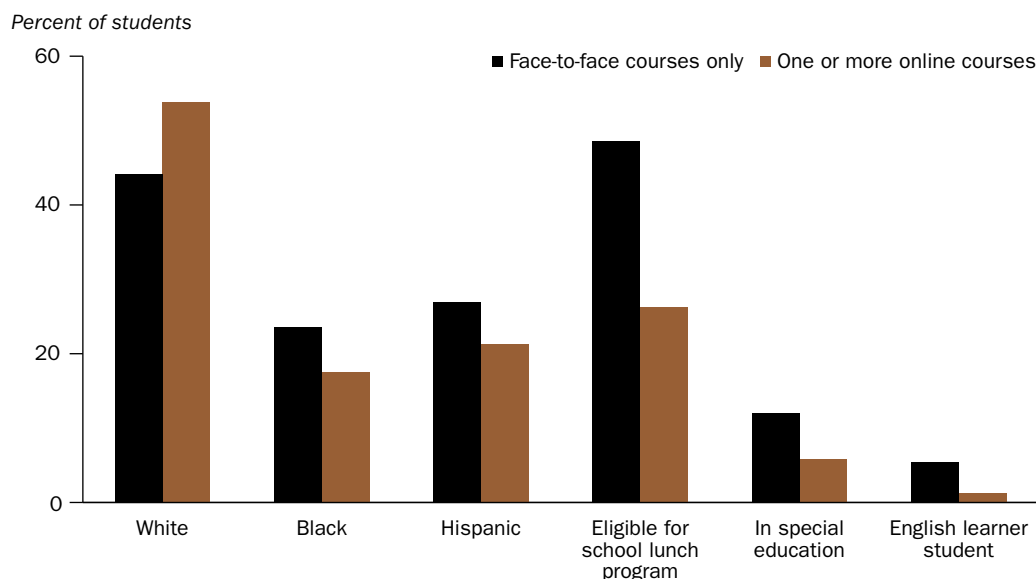

Because online enrollment reflects a choice on the part of students and their advisors, students who enroll in online courses may differ from those who do not. Some of these differences, such as motivation, technological confidence, and self-regulatory skills cannot be measured with the available data. Demographic differences, however, can be measured. Students who enrolled in one or more online courses were more likely to be White and less likely to be Black or Hispanic compared with students who took only face-to-face courses. Students taking online courses were also less likely to be eligible for the school lunch program and less likely to be in special education or to be English learner students (figure 1).

In addition, the percentage of students scoring 3 or higher on the prior year's FCAT (see box 2) was higher for students selecting online courses than for students taking only face-to-face courses, both overall and within the same demographic subgroups (figure 2; see appendix B for additional years of data). These results suggest that students who either independently selected online courses or were counseled to take them tended to be somewhat higher performing on the FCAT than students who only took face-to-face courses.

Some of the differences shown in figures 1 and 2, particularly prior-year FCAT scores, are likely to be related to a student's chances of earning a C or better. For example, students with higher FCAT scores are probably also more likely to earn higher grades. That students taking online courses were more likely to pass the FCAT should be taken into

*Students who enrolled in one or more online courses were more likely to be White and less likely to be Black or Hispanic compared with students who took only face-to-face courses*

**Figure 1. Students who took online courses were demographically different from those who did not, 2010/11**

**Note:** The bars reflect the percentage of students in each category—those who took one or more online courses and those who took only face-to-face courses. The taller bar for White students who took one or more online courses indicates that among White students a larger percentage took online courses than took face-to-face courses; among the other subgroups a larger percentage took face-to-face courses than online courses. All differences are statistically significant.

**Source:** Authors' analysis of transcript data provided by the Florida Department of Education's Education Data Warehouse.

**Figure 2. Students who took online courses typically performed higher on the prior year’s Florida Comprehensive Assessment Test than those who did not, 2010/11 (percent of students scoring 3 or higher)**

Percent of students who passed the prior year’s Florida Comprehensive Assessment Test

*The percentage of students scoring 3 or higher on the prior year’s Florida Comprehensive Assessment Test was higher for students selecting online courses than for students taking only face-to-face courses, both overall and within the same demographic subgroups*

**Note:** Scores of 3 or higher on the Florida Comprehensive Assessment Test (FCAT) are considered on grade level or “passing” for the purposes of these analyses. The bars reflect the percentage of students in each category who passed the FCAT—those who took one or more online courses and those who took only face-to-face courses. The taller bar for White students who took one or more online courses indicates that among White students pass rates on the FCAT were higher for students who took online courses than for students who took face-to-face courses; the same held true for all student subgroups. All differences are statistically significant.

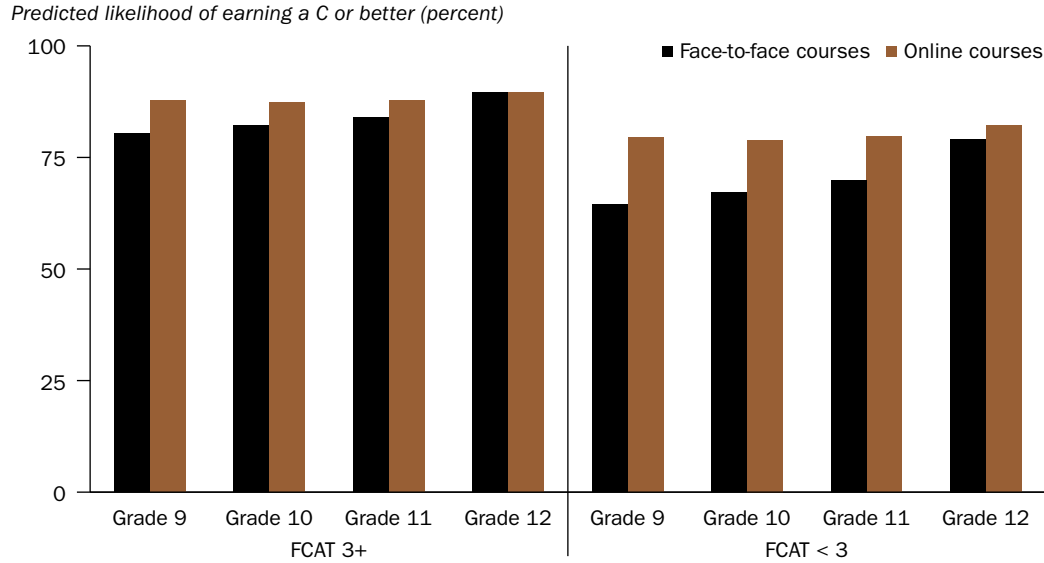

**Source:** Authors’ analysis of transcript data provided by the Florida Department of Education’s Education Data Warehouse.

account in comparing face-to-face and online outcomes. The above factors were statistically controlled for in the following analyses, and each subgroup was analyzed separately to make it easier to see how individual subgroups performed in online courses compared with face-to-face courses.

**For the 20 most common online academic courses, the likelihood of earning a C or better was higher when the student took the course online instead of face to face**

Three patterns were found in the results shown in figure 3. First, except for grade 12 students with prior-year FCAT scores of 3 or higher, students taking online courses had a higher probability of earning a C or better than students taking the same courses face to face. Among students with an FCAT score of 3 or higher, the likelihood of success online compared with face to face was 7.3 percentage points higher in grade 9, 5.2 percentage points higher in grade 10, and 3.9 percentage points higher in grade 11. In grade 12 the difference was negative, -0.1 percentage point, meaning that the predicted likelihood of earning a C or better was slightly higher in face-to-face than in online classes. The difference was statistically significant, meaning that it was not likely due to chance, but very small, indicating little substantive difference from a policy perspective. Among students who scored less than 3 on the FCAT, the differences in the likelihood of success between online and face-to-face courses were even larger: 14.9 percentage points in grade 9, declining to 3.1 percentage points in grade 12.

**Figure 3. Students taking one of the 20 most common online academic courses generally had a higher likelihood of earning a C or better than students taking one of these courses face to face, 2010/11**

**Note:** FCAT 3+ indicates that a student scored 3 or higher on the prior-year Florida Comprehensive Assessment Test (FCAT), which is considered on grade level or “passing” for the purposes of these analyses. FCAT < 3 indicates that a student scored less than 3 on the prior-year FCAT. All differences are statistically significant. This figure uses results from the most recent year of data (2010/11), which were consistent with the results across all years.

**Source:** Authors’ analysis of transcript data provided by the Florida Department of Education’s Education Data Warehouse.

*Among students with an FCAT score of 3 or higher, the likelihood of success online compared with face to face was 7.3 percentage points higher in grade 9, 5.2 percentage points higher in grade 10, and 3.9 percentage points higher in grade 11*

Second, students with lower FCAT scores tended to have lower probabilities of earning a C or better, whether in face-to-face or in online courses.

Third, probabilities of success increased at each grade level, especially for face-to-face course students. For example, face-to-face course students with FCAT scores of 3 or higher had a predicted likelihood of earning a C or better that ranged from 80.4 percent in grade 9 to 89.5 percent in grade 12. Similarly, face-to-face course students with FCAT scores below 3 had predicted likelihoods of earning a C or better that ranged from 64.5 percent in grade 9 to 79.1 percent in grade 12 (see appendix B for more information).

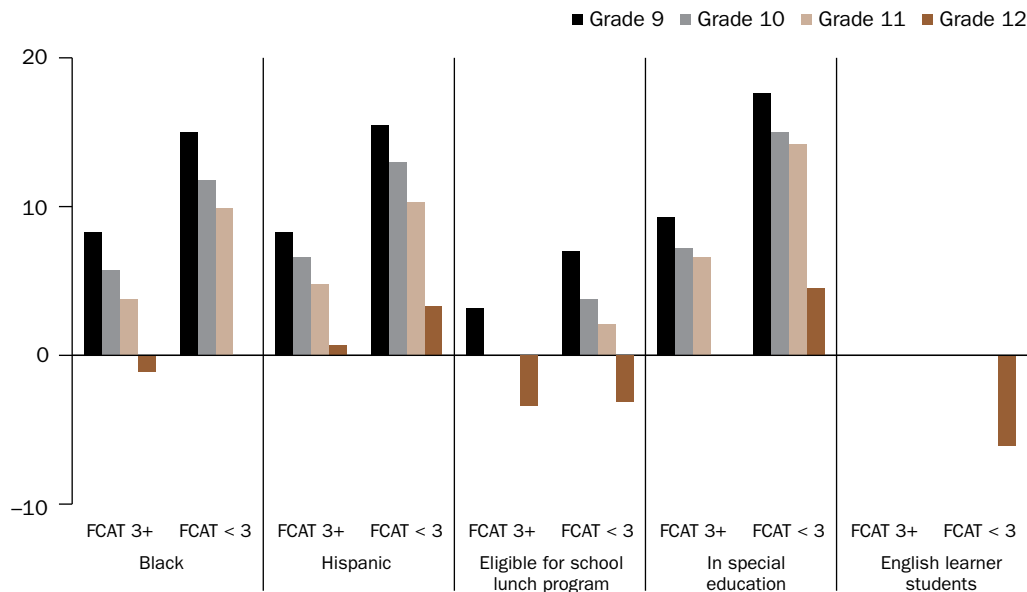

**The likelihood of earning a C or better in an online course was equal to or higher than that likelihood in a face-to-face course for most subgroups**

Results were also analyzed separately for Black students, Hispanic students, students eligible for the school lunch program, students in special education, and English learner students (see appendix B for more subgroup-specific graphs and details).

For most subgroups, the likelihood of earning a C or better was higher in an online course than in a face-to-face course, as shown by a positive difference between online and face-to-face courses in figure 4 (and evidenced by the positive coefficients for online courses in appendix B). Exceptions were in grade 12 and among English learner students. However, the differences grew smaller in higher grade levels (see appendix B), and some differences emerged across subgroups. The pattern for each subgroup and whether each comparison is statistically significant are shown in figure 4.

**Figure 4. Most subgroups had a higher likelihood of earning a C or better in online courses than in face-to-face courses, 2010/11**

Difference in predicted likelihood of earning a C or better between online and face-to-face courses (percentage points)

*For Black students, success rates were higher in online courses than in face-to-face courses for grades 9–11, and the differences were statistically significant*

**Note:** Results that are not statistically significant are not displayed. FCAT 3+ indicates that a student scored 3 or higher on the prior-year Florida Comprehensive Assessment Test, which is considered on grade level or “passing” for the purposes of these analyses. FCAT < 3 indicates that a student scored less than 3 on the prior-year FCAT. The bars represent the difference in predicted likelihood of success between online and face-to-face courses, where a positive difference means the chances of earning a C or better were higher in online courses. This figure uses results from the most recent year of data (2010/11), which were consistent with the results across all years.

**Source:** Authors’ analysis of transcript data provided by the Florida Department of Education’s Education Data Warehouse.

The analyses also showed that:

- For Black students, success rates were higher in online courses than in face-to-face courses for grades 9–11, and the differences were statistically significant. In grade 12, students scoring 3 or higher on the FCAT performed worse in online courses than in face-to-face courses. Grade 12 students scoring less than 3 on the FCAT had an equal likelihood of earning a C or better in online and face-to-face courses.
- For Hispanic students, success rates were higher in online courses than in face-to-face courses, and the differences were statistically significant in every grade level, though the difference was much smaller in grade 12.
- Among students eligible for the school lunch program with FCAT scores of 3 or higher, only grade 9 students showed a positive and statistically significant difference in the rate of earning a C or better in online courses compared with face-to-face classes; grade 12 students showed a statistically significant lower success rate in online courses than in face-to-face courses. For students scoring less than 3 on the FCAT, the success rates in grades 9–11 were higher in online than in face-to-face courses, and the differences were statistically significant. In grade 12 the difference was negative and statistically significant, meaning that the probability of earning a C or better was lower in online than in face-to-face courses.
- Students in special education had a statistically significant higher likelihood of success in online courses in every case except grade 12 students who scored 3 or higher on the FCAT; their likelihood of earning a C or better was the same in online and face-to-face courses.

- English learner students had the most distinct pattern of results. Students scoring 3 or higher on the FCAT showed no difference between online and face-to-face course outcomes. Students with FCAT scores below 3 in grades 9–11 also showed no differences. However, grade 12 students who had not passed the FCAT had a statistically significant 6.1 percent lower likelihood of earning a C or better in online courses compared with face-to-face courses.

**Students who attempted credit recovery online had higher likelihoods of earning a C or better than those taking the same courses face to face**

The previous analysis used a sample of students taking all academic courses, including both credit recovery courses and courses not used for credit recovery (see boxes 2 and 3 for definitions and details). To examine the differences in online and face-to-face courses for credit recovery in greater depth, a separate analysis was conducted. The 20 most common online academic courses taken for credit recovery were identified, and the face-to-face course sample was limited to these courses to ensure that grades for similar courses were being compared (table 3).

**Table 3. Enrollment in the 20 most common online credit recovery courses in Florida, 2007/08–2010/11**

| Course  | 2007/08 | 2008/09 | 2009/10 | 2010/11      | Total, 2007/08–2010/11 |

a. Excluded in 2010/11 because the course grading was changed to include results from an end-of-course exam.

**Source:** Authors' analysis of transcript data provided by the Florida Department of Education's Education Data Warehouse.

Students taking one of the 20 most common online credit recovery courses had a much higher likelihood of earning a C or better than students taking the same courses face to face (figure 5).

As with the sample of all courses described in the last section, the likelihood of earning a C or better increased by grade level for face-to-face courses, where success rates climbed from lows around 60 percent for grade 9 to highs around 90 percent for grade 12. In contrast, the likelihood of earning a C or better in online courses was stable in the 94–96 percent range across grade levels. Thus the success gap between online and face-to-face courses was 36.6 percentage points in grade 9, the largest difference found in the study, falling to 4.3 percentage points in grade 12. These differences were statistically significant and positive across all grades and years.

Prior-year FCAT success was not as strongly related to grades in credit recovery courses as it was in the sample of all courses. The difference between the likelihood of earning a C or better for students who had scored a 3 or higher on the FCAT and those scoring below a 3 differed by only 2–3 percentage points. Although this difference was statistically significant (meaning that it was not likely due to chance), it was relatively small, indicating little substantive difference from a policy perspective.

*The success gap between online and face-to-face credit recovery courses was 36.6 percentage points in grade 9, the largest difference found in the study, falling to 4.3 percentage points in grade 12*

**Among student subgroups, performance in credit recovery online courses differs only for English learner students**

All student subgroups other than English learner students showed a higher likelihood of earning a C or better in online credit recovery courses than in face-to-face courses.

**Figure 5. Students taking one of the 20 most common online credit recovery courses online had a higher likelihood of earning a C or better, 2010/11**

**Note:** FCAT 3+ indicates that a student scored 3 or higher on the prior-year Florida Comprehensive Assessment Test, which is considered on grade level or “passing” for the purposes of these analyses. FCAT < 3 indicates that a student scored less than 3 on the prior-year FCAT. All differences are statistically significant. This figure uses results from the most recent year of data (2010/11), which were consistent with the results across all years.

**Source:** Authors’ analysis of transcript data provided by the Florida Department of Education’s Education Data Warehouse.

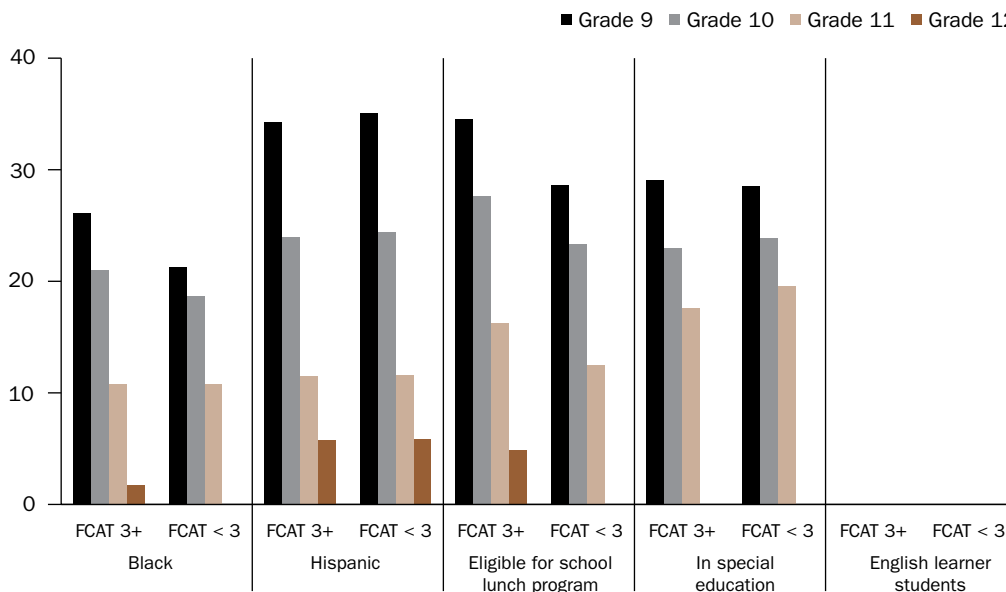

English learner students' success rates in online and face-to-face credit recovery courses were not significantly different (figure 6), meaning that they were about as likely to earn a C or better in an online course as a face-to-face course. This finding mirrors the result for English learner students in grades 9–11 in general courses (see figure 4). In all, English learner students consistently evidenced a different pattern from other subgroups, generally having similar predicted likelihoods of success online and face to face where other subgroups tended to perform better online. Future research should examine this more closely.

A similar pattern repeated for the other subgroups; there was always a higher likelihood of success in online recovery courses than in the sample of all courses, but the difference declined at higher grade levels. In a few cases, the differences were not significant. Specifically, grade 12 Black students and students eligible for the school lunch program scoring less than 3 on the FCAT and grade 12 students in special education (regardless of FCAT score) showed no difference in predicted likelihood of earning a C or better in online courses than in face-to-face recovery courses. For the other subgroups (except for English learner students), the success gap between online and face-to-face courses was 21–36 percentage points in grade 9, dropping to 2–6 percentage points in grade 12.

*English learner students consistently evidenced a different pattern from other subgroups, generally having similar predicted likelihoods of success online and face to face where other subgroups tended to perform better online*

**Figure 6. For every subgroup except English learner students, the likelihood of earning a C or better in recovery courses online was higher than in face-to-face courses, 2010/11**

*Difference in predicted likelihood of earning a C or better between online and face-to-face courses (percentage points)*

**Note:** Results that are not statistically significant are not displayed. FCAT 3+ indicates that a student scored 3 or higher on the prior-year Florida Comprehensive Assessment Test, which is considered on grade level or “passing” for the purposes of these analyses. The bars represent the difference in predicted likelihood of success between online and face-to-face courses, where a positive difference means the chances of earning a C or better were higher in online courses. This figure uses results from the most recent year of data (2010/11), which were consistent with the results across all years.

## **Limitations of the study and next steps**

---

It is critical to note that this study does not provide causal evidence that online learning is better than face-to-face instruction. The study design does not allow for causal inferences and none should be made on the basis of these results. It is possible that students who choose to enroll in online courses or whose advisors recommend online courses have differences that could affect their chances of earning a C or better. It is clear, for example, that students who took online courses were demographically different from those who did not. While demographics were taken into account in these models, it is possible that the students differ in other ways not captured in this study, such as being more self-motivated or better at self-regulation. Such differences are not measurable in the available data but could contribute to the observed differences in success rates.

Another limitation is that this analysis was conducted at the student level and did not attempt to cluster students into multiple levels based, for example, on shared teachers or shared schools/virtual programs. A multilevel modeling approach might be considered as part of a more causal research design.

In addition, the rigor of these courses and the level of student learning cannot be measured with the available data. Course grades themselves are inherently subjective and are not a direct measure of student learning because of the absence of an objective assessment. The majority of the online courses in these analyses came from the Florida Virtual School, and the results may not be applicable to other online settings. Finally, the administrative data did not explicitly identify online courses or credit recovery courses, and the process of identifying that data could have introduced errors or omissions.

The results presented in this analysis do, however, lay the groundwork for additional study. Future research could focus on courses with end-of-course exams to better compare levels of face-to-face and online student learning. Additional research is also needed to look more closely at performance among different student groups. Why do English learner students respond differently to online instruction? Is it a function of language literacy or something else? Are there other groups of students, perhaps not identifiable by a demographic characteristic, who are less suited to online instruction? What supports might be needed for students who are less prepared for online instruction? Are there academic or self-regulatory skills that lend themselves differently to success in an online environment? Finally, research designs that provide stronger causal connections would greatly add to the strength of the research base on this topic.

***The results presented in this analysis lay the groundwork for additional study. Future research could focus on courses with end-of-course exams to better compare levels of face-to-face and online student learning***

## Appendix A. Data and methodology

This appendix provides details on the data sources and the study methodology.

### Data

The data for these analyses were provided by the Florida Department of Education (FLDOE) through its Education Data Warehouse (EDW). The EDW provided a statewide dataset of de-identified transcripts for students taking high school courses in 2006/07–2010/11. The dataset included information on each course: the course name and number, grade, year and term, credit earned, and school of instruction. The FLDOE also provided demographic and academic information on each student, including scores on the statewide reading and math assessments. Specifically, the EDW provided the following data files:

- Student demographics.
- Whether student is in special education.
- Florida Comprehensive Assessment Test (FCAT) scores.
- Transcript table.
- Transcript designator.
- Course record.
- Institution/school.

### Methodology

**Identifying online courses.** The FLDOE administrative database does not contain an online course identifier for each of the years covered by the study. However, the state’s master school identification number (MSID) was used to identify all courses provided by a district virtual program or through the Florida Virtual School. The MSID, which is found in the institution file, is a six-digit number in which the first two digits denote the school district and the last four digits denote the specific school. The Florida Virtual School is designated as school district 71 so all of its courses start with “71” as in 71xxxx. The district virtual school program courses are given “school codes” of 7001, 7004, 7006, or 7023. A course from those programs would end with one of those school codes as in xx7001, xx7004, xx7006, or xx7023. All courses identified by these numbers were coded as online and became the population for the online course analyses.

These identification numbers were created to track legislatively mandated virtual programs offered by districts or third-party providers. A virtual program is a systematic collection of online course offerings, typically covering a number of courses. Prior to creation of a virtual program identified through an MSID, a district may have offered individual online courses. However, this is unlikely because there was no legislative mandate or funding mechanism for such courses and the Florida Virtual School was created largely to provide that service. The number of previously created courses would likely be very small. Thus, the MSIDs are the most appropriate and only feasible way to identify the online courses for the period of this study.

**Identifying credit recovery courses.** Identifying a credit recovery course relied on a FLDOE database field that reports whether a course is included or excluded from the high school transcript for graduation purposes. The include/exclude flag is found on the transcript designator file. When a student takes and passes a course, the course is designated as “include”

for the final transcript. When a student fails a course and then retakes it, the first course is “excluded” and the second course is included in the final transcript. This can happen for credit recovery or for grade replacement where a student is simply seeking a higher grade. Therefore, credit recovery courses are identified as repeated courses where the first course had a grade of F; in this case, the first course was excluded and the second was included. Because credit recovery requires repeating courses and because the transcript data begin in 2007/08, the credit recovery course analyses are limited to 2008/09–2010/11.

**Definition of course success.** Success in a course is defined as earning a C or better. While “passing” a course requires only a grade of D, Florida high school graduation requires a 2.0 grade point average. Students are eligible to retake a course for a higher grade if they receive a grade of F or D. The grade of C, therefore, is used as the cutoff because a grade of C reflects more stringent criteria for successful completion.

**Determination of course grade.** Many courses are two semesters long and thus have two grades. The analyses used the first grade (or first semester) as the outcome for the course because it is most proximal to the failed courses.

**Sample.** This study presents results for the 20 most common academic courses from two samples. The first sample represents all high school courses taken between 2007/08 and 2010/11. This sample includes both credit recovery courses and other academic courses. The sample of all courses includes about 4,000–4,500 face-to-face courses each year while the number of online courses ranges from 223 to 328 and grew each year (table A1). Five common but nonacademic courses in physical education and driver’s education were eliminated from this sample to focus on comparing academic courses.

The second sample includes only credit recovery courses and is much smaller. Because credit recovery courses take place after the student fails a prior course, there were very few such courses in 2007/08 and they were removed from the analyses.

The analyses were limited to a subset of the most common courses to ensure that the grades used for defining course success came from similar courses. Using online grades from courses that were substantially different from the courses that face-to-face grades were from would introduce a potential source of error.

**Table A1. Count of students and courses in analyses**

| School year | All courses      |                      |                | Credit recovery courses |                      |                |
|-------------|------------------|----------------------|----------------|-------------------------|----------------------|----------------|
|             | Total enrollment | Face-to-face courses | Online courses | Total enrollment        | Face-to-face courses | Online courses |
| 2007/08     | 879,166          | 4,084                | 223            | —                       | —                    | —              |
| 2008/09     | 871,797          | 4,258                | 225            | 39,251                  | 618                  | 57             |
| 2009/10     | 867,494          | 4,434                | 299            | 45,983                  | 672                  | 73             |
| 2010/11     | 845,933          | 4,488                | 328            | 41,065                  | 635                  | 70             |

— is not available because transcript data begin in 2007/08.

**Note:** Because students can be in more than one course, the table presents the total number of students in the analyses—not the number in each group of courses.

**Source:** Authors’ analysis of transcript data provided by the Florida Department of Education’s Education Data Warehouse.

**FCAT scores.** The FCAT is given in reading and math in the spring of grades 3–10. Scores on the FCAT take several forms. There is a scale score, a developmental scale score, and an achievement level. The scale score ranges from 100–500 for each grade. The developmental scale score is designed to measure growth from grade to grade. Both of these scores translate into achievement levels that range from 1 to 5; scores of 3 and above are considered on grade level or “passing” for the purposes of these analyses. The FCAT scores were collapsed into a single score where 1 = student has passed both the reading and math sections and 0 = the student has failed one or more sections. This was done to facilitate reporting the results for differential FCAT performance. The FCAT score used for each student is either the prior-year score or, if the student is in grades 11 or 12, his or her grade 10 score.

**Analyses.** The main results presented the percentage chances of earning a C or better in a course. These results were calculated from the odds produced by logistic regression models. Logistic regression produces a predicted probability of an event occurring for each case or student in the data based on the predictor variables.

In these analyses a dummy variable was used to indicate whether a student took the course online or face to face. Online was coded as 1, and face to face was coded as 0, so a positive coefficient for that dummy variable indicates that the predicted probability of a student earning a C or better was higher online than face to face (see appendix B for full results). The same models were run for the overall student population and then for five key sub-groups: Black students, Hispanic students, students eligible for the school lunch program, students in special education, and English learner students.

The basic models also included several control variables. First, each academic year was dummy-coded with the first academic year as the reference group. This made it possible to produce a percent chance of earning a C or better for each year and to track trends over time. Second, each grade level was dummy-coded with grade 9 as the reference group. Third, the FCAT passing dummy variable was included. Finally, interaction terms for the online variable of interest and the other control variables were used to make it possible to generate contrasts testing whether differences in specific grades or years were statistically significant. See appendix B for the contrast results.

For the analyses of all courses, no other control variables were included. For the analyses of credit recovery courses, an additional dummy code was included to reflect whether the failed course was taken online. For the purposes of this study, only chances of earning a C or better for students who did not initially fail online are included.

A threshold of  $p < 0.05$  was used in all analyses to determine statistical significance. The standard errors were not clustered at any level and the variances were assumed to be equal across levels.

**Missing data.** Some students were missing FCAT scores in reading or math. When data are missing on a key variable like FCAT scores, rather than discard those cases (students) it is possible to “impute” the missing data. Imputation is a process of filling in the missing data with plausible values generated from analyzing students with complete data. In this case, academic year, grade level, earning a grade C or higher, and demographic variables, including ethnicity, eligibility for the school lunch program, English learner student status,

and special education status, were used. Those variables were used to predict FCAT scores that could then be validated against students with FCAT scores to ensure the predictions are reasonable. The imputation method used was Markov Chain Monte Carlo (Enders, 2010). Using the variables above generated 10 imputations, and the imputed data set had 391,610,760 ( $39,161,076 \times 10$ ) observations.

## Appendix B. Detailed results

This appendix lists the courses included in the two samples of all courses and credit recovery courses and the demographic differences and Florida Comprehensive Assessment Test (FCAT) score differences among students who took online versus face-to-face courses. Figures display the chance of earning a C or better in online and face-to-face courses for various groups and subgroups of students for each grade over four years. Logistic regression coefficients and contrast results are given for results in each figure.

FCAT is the Florida Comprehensive Assessment Test. FCAT 3+ indicates that a student scored 3 or higher on the prior-year Florida Comprehensive Assessment Test, which is considered on grade level or “passing” for the purposes of these analyses. FCAT < 3 indicates that a student scored less than 3 on the prior-year FCAT.

## The Regional Educational Laboratory Program produces 7 types of reports

### **Making Connections**

Studies of correlational relationships

### **Making an Impact**

Studies of cause and effect

### **What's Happening**

Descriptions of policies, programs, implementation status, or data trends

### **What's Known**

Summaries of previous research

### **Stated Briefly**

Summaries of research findings for specific audiences

### **Applied Research Methods**

Research methods for educational settings

### **Tools**

Help for planning, gathering, analyzing, or reporting data or research
